1 Description

Fastest & Securest USB 2.0 Flash Disk Controller with dedicated 32-bit microprocessor

The CBM2096P is the USB 2.0 Flash Disk controller with the fastest transfer speed on the market. CBM2096P can reach theoretical flash access speed limit of over 32MByte/s for read and 20MByte/s for write.

The on-the-fly ECC engine is capable of correcting up to 16/25/29/30bits per 1024 bytes page . For data security, CBM2096P is designed with both hardware and software data protection technology to prevent data corruption even if it is powered off or unplugged during data transfer.

The CBM2096P supports all 8 /16 bit BUS wide async NAND flash memory available in the market. New flash can be supported by software re-configuration.

The CBM2096P supports all 8 bit BUS wide ONFI/TOGGLE NAND flash memory available in the market. New flash can be supported by software re-configuration.

The CBM2096P has both a) 5V to 3.3V LDO and b) power on reset circuits integrated. Thus greatly reduced BOM cost and eased layout burden.

The CBM2096P runs smoothly with all available hosts and PC platforms. Complied with USB specification rev. 2.0, the CBM2096P can be supported without additional driver under Win XP, Win 2000, Windows Me, Mac OS and Linux OS. With device driver installed, it can support Win 98/98SE as well. Comprehensive applications, such as PC boot up, disk partitions, password check for security disk, are available as part of our standard mass production software package.

The CBM2096P is available in 48-pin TQFP and 64-pin LQFP package, which are thinnest and smallest on the market. The 48-pin CBM2096P and the 64-pin CBM2096P all support up to 8 flash chips. Customers can choose different packages to meet their design requirement.

2 Features

■ **USB Interface**

High-speed USB 2.0 interface;

■ **Fastest data transfer rate on the market**

Single-channel mode(16bit): 32MB/s for Read, 20MB/s for Write

Single-channel mode(8bit): 26MB/s for Read, 20MB/s for Write

Fastest file copy rate on the market.

■ **On-the-fly ECC built-in Hardware enhances reliability**

ECC for NAND flash: 16/25/29/30 bit per page (1 page = 1024 bytes)

■ **Special wear leveling algorithm to improve the flash life-time**

■ **Hardware & Software Data Protection Technology**

Prevent data corruption even if it is powered off or unplugged during data transfer.

■ **SLC & MLC & TLC NAND Flash Interface**

Support 8-bit and 16-bit Samsung SLC&MLC&TLC NAND flash.
Support 8-bit and 16-bit Toshiba SLC&MLC&TLC NAND flash.
Support 8-bit and 16-bit Hynix SLC&MLC&TLC NAND flash.
Support 8-bit and 16-bit Sandisk SLC&MLC&TLC NAND flash.
Support 8-bit and 16-bit Micron/Intel SLC&MLC&TLC NAND flash.
Support 8-bit and 16-bit ST/Numony SLC&MLC NAND flash.
Support 8-bit and 16-bit Infineon SLC&MLC NAND flash.
Support PowerChip SLC&MLC Nand flash
Support Spansion 3.3V MirrorBit-Quad flash
Support Actrans Nand Flash
Support ONFI2.0 DDR mode flash
Support Samsung Toggle mode flash
Software configuration to support various new flash memories
Supports up to 8 flash chips

■ **Proprietary 32-bit CISC microprocessor feature**

Proprietary 32-bit CISC processor for USB protocol processing and flash access.
Single cycle instruction period

■ **Integrated 5v to 3.3v voltage regulator**

■ **Disk partitions and password check for security disk available**

■ **PC boot up as USB Zip Disk, USB Hard Disk or USB CDROM**

■ **Auto run function**

■ **Low power dissipation**

Operating current 60mA (Bus power compatible)

■ **Build-in LDO**

Output maximum current up to 300mA

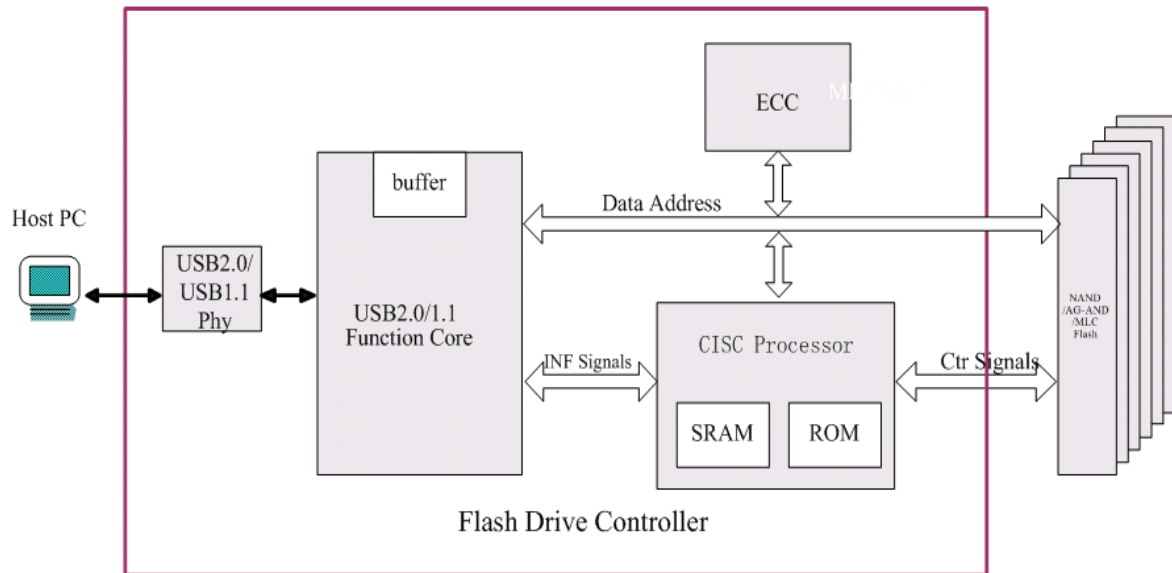

■ **Leading 0.16um CMOS technology**

■ **48-pin TQFP /64-pin LQFP package**

48-pin CBM2096P supports up to 8 Flash Chips

Windows, Mac and Linux compatible

- Notes:
1. Delay is from start of command to next command, address, or data cycle; start of address to next command, address, or data cycle; and end of data to start of next command, address, or data cycle.
 2. This value is specified in the parameter page.
 3. $t_{CK}(\text{avg})$ is the average clock period over any consecutive 200-cycle window.
 4. $t_{CKH}(\text{abs})$ and $t_{CKL}(\text{abs})$ include static offset and duty cycle jitter.
 5. t_{DQSHZ} begins when W/R# is latched HIGH by CLK. This parameter is not referenced to a specific voltage level; it specifies when the device outputs are no longer driving.
 6. If RESET (FFh) is issued when the target is idle, the target goes busy for a maximum of 5 μs .

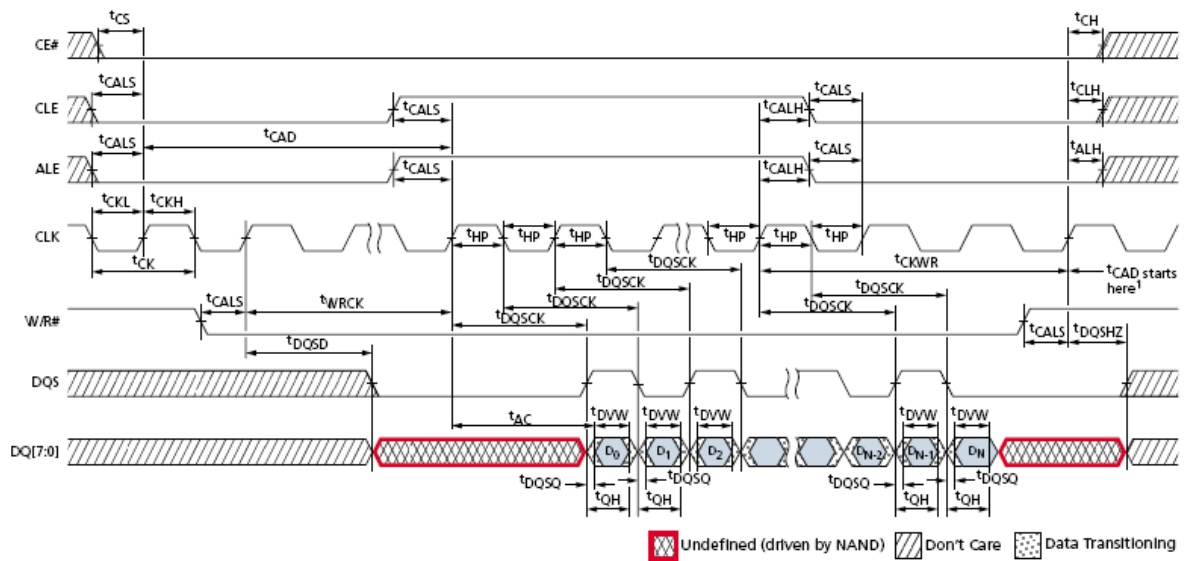

Notes: 1. When CE# remains LOW, t_{CAD} begins at the rising edge of the clock from which the command cycle is latched for subsequent command, address, data input, or data output cycle(s).

Notes: 1. When CE# remains LOW, t_{CAD} begins at the rising edge of the clock from which the command cycle is latched for subsequent command, address, data input, or data output cycle(s).

2. $t_{DSH}^{(MIN)}$ generally occurs during $t_{DQSS}^{(MIN)}$.
3. $t_{DSS}^{(MIN)}$ generally occurs during $t_{DQSS}^{(MAX)}$.

- Notes:
1. When CE# remains LOW, t_{CAD} begins at the rising edge of the clock after t_{CKWR} for subsequent command or data output cycle(s).
 2. See Figure 25 on page 33 for details of W/R# behavior.
 3. t_{AC} is the DQ output window relative to CLK and is the long-term component of DQ skew.
 4. For W/R# transitioning HIGH: DQ[7:0] and DQS go to tri-state.
 5. For W/R# transitioning LOW: DQ[7:0] drives current state and DQS goes LOW.
 6. After final data output, DQ[7:0] is driven until W/R# goes HIGH, but is not valid.

Write Preamble	twPRE	15	-	15	-	15	-	ns
Write Postamble	twPST	6.5	-	6.5	-	6.5	-	ns
Write Postamble Hold Time	twPSTH	5	-	5	-	5	-	ns
Output skew among data output and corresponding DQS	tDQSQ	-	2.5	-	2	-	1.4	ns
DQS hold skew factor	tQHS	-	2.5	-	2	-	1.4	ns
Output hold time from DQS	tQH	$tQH = tREH/IRP - tQHS$						ns
Output data valid window	tdVW	$tdVW = tQH - tDQSQ$						ns
Device Resetting Time (Read/Program/Erase)	trST ⁽¹⁾	10/30/100						μs

NOTE :

1. Command information is latched by \overline{WE} going high, when \overline{CE} is Low, CLE is High, and ALE is Low.
2. DQS should be set to 'Low' when these commands(85h, 10h, 11h) is input.

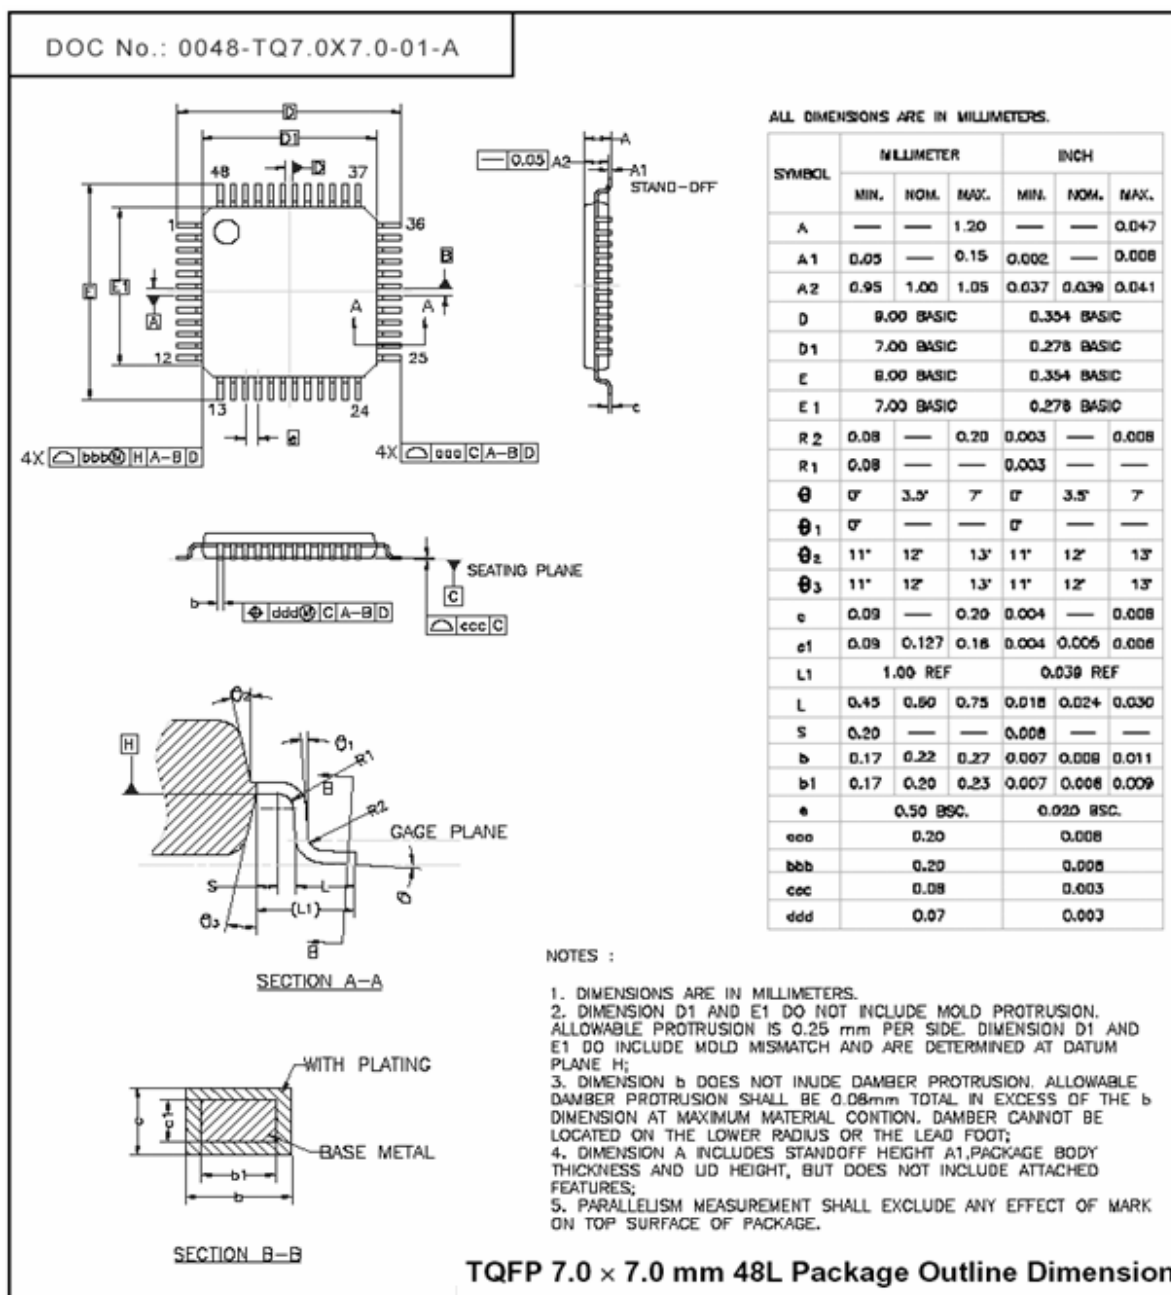

NOTE :

- 1) Data-output condition should be satisfied before \overline{RE} toggling for data output; data-output condition is that \overline{CE} & \overline{CLE} & \overline{ALE} are low and \overline{WE} is high
- 2) \overline{RE} should be either high or low before data-output condition is set.
- 3) Data-output condition should be kept during \overline{RE} toggling for data output including pre-amble and post-amble time.
- 4) DQS and Data out buffers are turned on when \overline{RE} is low for pre-amble operation under data-out condition
- 5) DQS and Data out buffers turn from valid value to high-z if either \overline{CE} or \overline{CLE} goes High.
- 6) an even number of bytes should be always transferred when both data input and data output
